

**Made in America**

**Lifetime Guarantee**

Thank you for purchasing this instrument panel from Intellitronix. We value our customers!

## **INSTALLATION GUIDE**

**Jeep Panel 1992-95**

**Part Number: DP6013**

**\* Always disconnect the battery *before* attempting any electrical work on your vehicle.\***

## **KIT COMPONENTS**

**Three (3) Digital Circuit Boards: One for Speedometer; one for fuel, volts, temp and oil pressure, one for tachometer.**

**Three (3) Smoked Acrylic Lens**

**\* Peel off protective covering from both sides of each lens**

**One (1) Temperature Sending Unit (S8013) 1/8" NPT, 0-255 Deg., 1/2" NPT Bushing**

**One (1) Oil Pressure Sending Unit (S8434) 1/8" NPT, 0-99 PSI range**

**One (1) Universal Speedometer Sensor (S9013) 7/8" NPT Industry Standard threads**

**One (1) Mounting Kit**

**Two (2) 6-32 X 1-inch Pan Head Phillips screws**

**Four (4) # 6 X 1/2 inch spacers**

**Nine (9) 4-40 X 1-inch Taper Head Phillips screws**

**Six (6) #4 X 3/8 Nylon spacers**

**Two (2) 6-32 Nylock nuts**

**Four (4) # 6 Nylon washers**

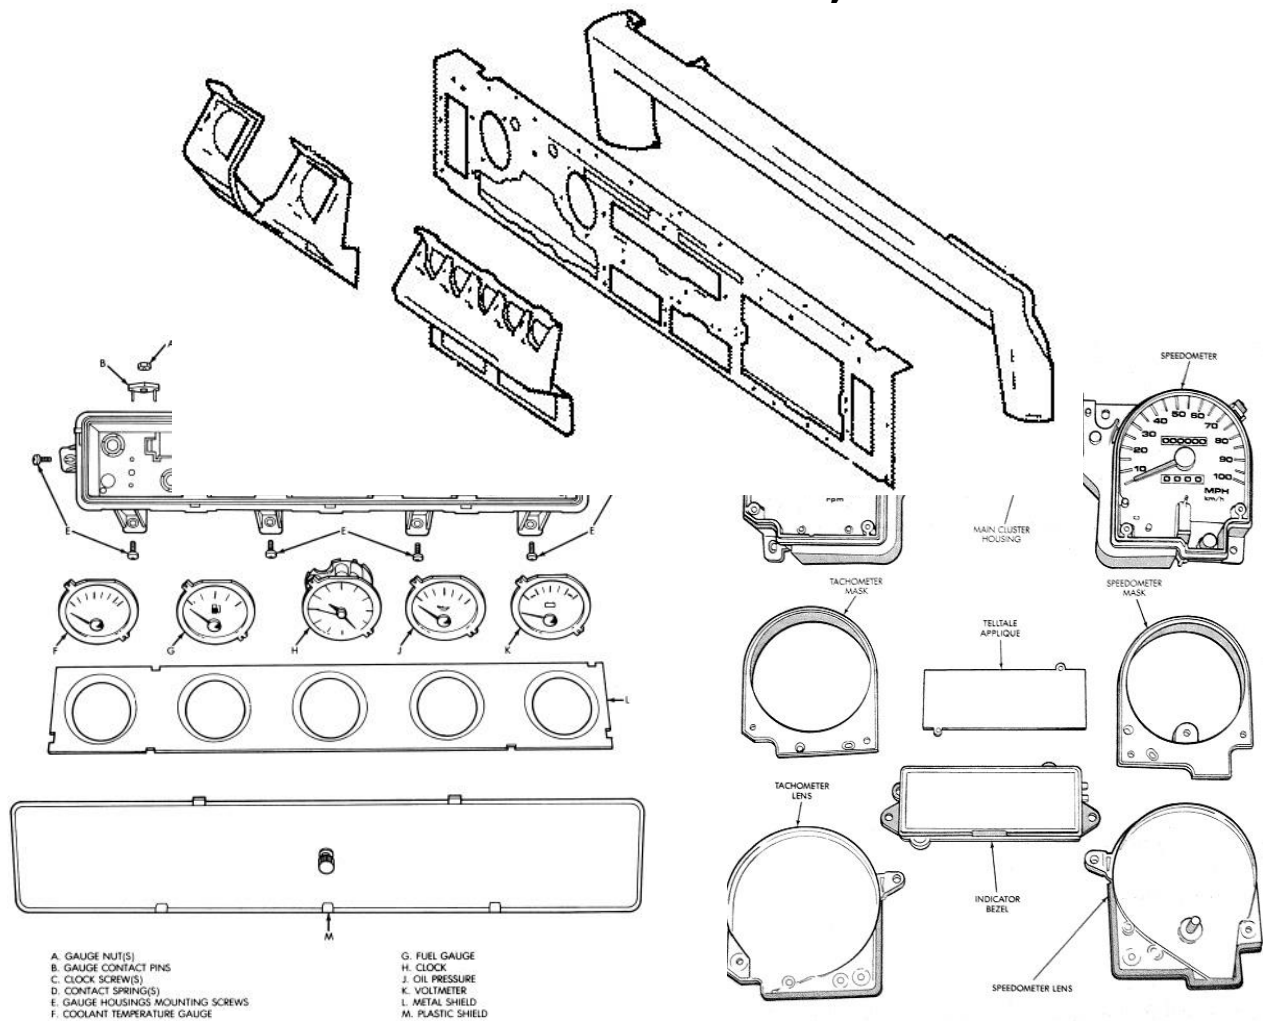

**Nine (9) 4-40 Nylock Nuts**

**Twelve (12) #4 Nylon Flat washers**

## DASHBOARD REMOVAL

1. Remove the existing Bezels and then remove dash clusters from the vehicle.
2. Separate the front of the Housing from the back housing then Remove Gauges an all bulbs EXCEPT WARNING LIGHTS You will be reusing warning and turn signals.
3. You will need to reuse the housing and some of the factory hardware. Set aside six screws from Tach/Speedo lenses and two screws from Gauge housing lens.

### Removal Illustration these are for you reference

Remove bezels and instrument housing  
Remove Gauges an all bulbs EXCEPT WARNING LIGHTD

# INSTALLATION

\*you will retain factory turn signals, high beams and warning lights

1. Build all three Gauges with Lens Using Provided Hardware kit before Installing Gauges.
  - (1) Tach & Speedo will need the #4 screw through lens then spacer next the board and then a nylon washer and last the Nylock nut.
  - (2) The Gauges are going to get two #6 screws in board to act as line up pins in bezel. #6 screw, washer through board then washer last Nylock nut. DO NOT OVER TIGHTEN THEM. These will hold a spacer and act as a line up pin later.
2. Place the Tach and Speedo assemblies into the original housing reusing the original bezels and lenses. Some minor clearancing on the housing for Tach/Speedo may need to be done. See the pictures below.
3. Place the Gauge assembly face down on clean surface and add ½ inch spacers to bolt on Gauge assembly. Then place housing over the gauge assembly and line up studs in housing turn both pieces over and place black bezel on gauges and line up small line up pins to bezel when sitting flat place lens and on reattach with original screws.
4. Wire the gauges and sending units to the panel as indicated by the instructions below

## WIRING INSTRUCTIONS

**Note:** Automotive circuit connectors are the preferred method of connecting wires. However, you may solder if you prefer.

**Note:** LS Engines or any other Computer based engine systems must use provided sensors and install new wires to new sensors

**Note:** If doing a LS engine swap, pick up the tach signal wire from the ECM/ECU and then set the tach switch to 4-cylinders. You may also need to order the Intellitronix LS Engine Swap Adapter Kit for Series 1, 2 and 3 engines. The part number is 8014LS. If you are getting the tach signal from the ECU, the resistor in the adapter kit will help pull a stronger signal for the tachometer. If your engine is a LS the Tachometer will need to be put into 4 cylinder mode by removing Resistors if the Tachometer does not have a push button for programing, please call Tech Support at Intellitronix, as you may need to send the gauge back to us to be reconfigured. There is no charge for this additional service.

**Ground – Black--**This is the main ground for the display system. A wire should be run from this board to the vehicle engine block for the best ground. Use 18 AWG or larger wire to ensure sufficient grounding. Proper vehicle grounding is extremely important for any gauges (or electronics) to operate correctly. The engine block should have heavy ground cables to the battery, frame, and firewall. Failure to properly ground the engine block, senders, or digital dash can cause incorrect or erratic operation.

**Power - Red--**Connect the power terminal to accessory +12V power from the fuse panel or vehicle wiring harness. Using a 5-amp fuse or an inline 5-amp fuse holder This terminal should have power when the key is on or in accessory position. Use 18 AWG wire to ensure the system receives a sufficient power feed.

**Water – Blue -** This gauge is incompatible with other sending units, so you must replace the existing water temperature sending unit with the included sender. **Do not** use Teflon tape or other sealer on the new sending unit's threads to avoid inaccurate readings. Connect the blue wire to the sending unit. For best results we suggest running a new wire.

**Water Ground – blue/black** If you have a 2-wire temperature sending unit this wire will go to the corresponding blue/black wire on the sender harness. If you have a 1-wire temperature sending unit, this wire will be grounded with the main grounds.

**Oil Pressure – Orange** - Replace the existing oil pressure sending unit with the unit included with your gauge. The Orange wire will be wired to the S terminal on the sending unit. This gauge is incompatible with other sending units.

**Oil Pressure Ground – Orange/black or brown/black** This wire will go to the G terminal on your oil pressure sending unit.

**Note: Before installing or Setting up you must know your Fuel sender OHMS Range to properly set Gauge up.**

**Fuel – Yellow** The fuel gauge sending unit is not supplied because the display system can use the existing fuel level sending unit in the tank in most cases. If your wiring harness already has a single wire routed through the vehicle for the fuel sender, then it may be used. If using a wire from an external harness, make sure that the wire does not have power and is 18 awg wire. Fuel senders reference their ground from the sender mounting plate. (Note: For the best ground, wire ground to the engine block.) For best connection run 2 wires to the fuel sender.) Connect the yellow wire to the factory sending unit.

**Fuel –Black/Yellow** – Run a new ground wire and attach to your Fuel sending unit housing to ensure proper fuel gauge operation. If the sending unit does not have a sufficient ground, it will not work properly.

This gauge cluster comes set **GM 0-90 OHM**

### **FUEL GAUGE TEST**

The most common problem with our Fuel Gauge not working is the circuit is not complete. The easiest way to test for this is to use a voltmeter and test for continuity on wires going to fuel sender after disconnecting from gauge. If not disconnected it will give you a false reading. With wire disconnected from Fuel Gauge check for continuity to ground. Then test for OHMS to verify within range of fuel sender. If you don't have an accurate reading. Run a new ground wire to engine without this the Gauge will not work properly. **Note: Verify Ohm range of sender and match settings before cutting a wire or setting Dip switches for testing**

**Dimmer – Purple** Connect to the parking lights to dim the LEDs 50% when the headlights are on. However, **\*DO NOT\*** connect to the headlight rheostat control wire, or the dimming feature will not work properly and may cause damage to Unit.

**Voltage Gauge** – This Gauge Requires no wire hookup. Volt Gauge is built into the dash panel and is powered by the main power and ground connection of the dash. It does have an Adjuster to fine tune the voltage. Note: you will need to adjust it before fully installing the dash

## **CABLE BUTTONS**

**Trip/Cal Button - Grey Cable Button or Push button on Dash** - There are two grey wires connected to the push-button for the speedometer board. Mount the switch in a convenient location such as under the steering column so that you may easily reset your trip odometer or other speedometer functions.

## **TACHOMETER**

**Note: If doing a LS engine swap, pick up the tach signal wire from the ECM/ECU and then set the tach switch to 4-cylinders. You may also need to order the Intellitronix LS Engine Swap Adapter Kit – for Series 1, 2 and 3 engines. The part number is 8014LS. If you are getting the tach signal from the ECU, the resistor in the adapter kit will help pull a stronger signal for the tachometer.**

### **Tachometer – Green**

If your vehicle has a **separate ignition coil**, connect the green wire to the **negative (-)** side of the coil – the wire that goes to the points or electronic ignition module.

To ensure that the ignition system does not interfere with any other dashboard functions, do not run the tachometer wire alongside any other sender or input wires. **Do not** use solid core spark plug wires with this dashboard system. Solid core ignition wires cause a large amount of electromagnetic and radio frequency interference which can disrupt the system's operation.

If your vehicle has a **GM HEI ignition**, connect to the terminal marked 'TACH', or, on some systems, a single white wire with a spade terminal.

If your vehicle has an **after-market ignition** – some systems will connect to the TACH output terminal.

If your vehicle has a **Computer controlled ignition** system, consult the service manual for the wire color and location.

If your vehicle has a **magneto** system, connect the tach signal wire to the negative side of the coil. **Do not** connect the tach terminal to the positive (+ or high voltage) side of the ignition coil. Many tachometers, shift lights or RPM-activated switches will not read directly from a Magneto, so your installation may need a Magneto Signal Converter to function properly.

**The default setting for the tachometer is for an 8-cylinder engine.**

## **PROGRAMBLE TACHOMETER SETTINGS**

To change settings:

The display will stay in Settings Mode until it receives a signal from the ignition system. To program the unit after starting the engine, shut the engine off and turn on only to the accessory position. When in accessory mode, the settings menu will scroll through the settings menu. A light tap on the button engages the menu system.

1. Sets # of digits in RPM display, using button, display shows: (hundreds) 8800, (tens) 8880, and (ones) 8888.
2. Sets # of cylinders using button, display shows: 1cy, 2cy, etc.
3. Sets first digit on max RPM on gauge bar display (in thousands) using button, display shows: 1000 to 9990

## SPEEDOMETER

**Speedometer – White - (Factory sender with Powertrain Control Module)** When using a LS engine swap, you will need to pick up the Speedometer signal wire from the PCM Pin 50 on the red connector. (This pin may Differ. Refer to your vehicles Pinout Chart for accuracy). Any other Computer based engine will need to use to use the PCM/ECM to run the speed signal for the Speedometer.(Consults Pinout Chart)

**Speedometer – White - (Factory two wire sender no PCM)** - Most vehicles built after 1984 have an electronic transmission sender. If your vehicle is already equipped with an electronic transmission, then the electronic vehicle sender will usually have Two wires attached to it. One connects to the Signal wire on dash (we prefer this to be high output). The other wire (Low output) Ground at the Engine block. To find High and Low output wire color or pin location will need to be looked up by Vehicle vin or Model and year or (Consults Pinout Chart).

**Speedometer - White (Intellitronix Speed Sender)** - Disconnect the mechanical speedometer cable from the transmission and thread the new electronic sensor onto the transmission. This panel comes with a 3-wire sensor. If you are using this sensor, the **white** wire is the speed signal; connect this to the speed signal wire on your gauge. The **red** and **black** wires in the cable are switch power (12VDC) and ground, respectively. **NOTE:**(Twist all Three wires together and this will provide an additional level of interference protection.) The speed signal wire should not be routed alongside the tachometer, ignition, or any other high-current or high-voltage wires

**White** -Wire is the speed signal; connect this to the speed signal wire on your gauge.

**Red** - Wires switch power (12VDC) and must be wired to **Red/White** on your Gauge.

**Black** - Wire is speed sensor ground and must be wired to **Black/White** on the Gauge.

*\*if working with an LS swapped vehicle you will not use the **red/white** or **black/white** wires*

## Trip Distance

A single *tap* of the recall button will activate the trip meter in the odometer display. A decimal point will appear which will indicate that you are in trip meter mode. *Holding* the recall button will clear out the trip distance. To return to the default odometer display, *tap* the recall button again. The decimal point will disappear, indicating that you are back in the default odometer display.

## Setting the Odometer

While scrolling through 'CAL' mode you will see 'ODO' appear. This will allow you to enter the vehicle's actual mileage. Press the trip button again at this point and you will enter the odometer set up mode. Press quickly to change the number of the digit on the right. Press and hold to advance to the next digit. Do this for all 5 digits. **For Example:** To enter the mileage reading 23456 into the odometer,

at the 'ODO' prompt, tap the small black button (quickly) two times, until the number **2** is displayed. Then press and hold the button until the numbers **20** are displayed. Tap the button 3 times until **23** is displayed. Press and hold the button until **230** is displayed and continue in this manner until **23456** is displayed. The speedometer will advance to the home screen, five seconds after the last number is entered.

## Recording and Viewing Performance Data

Follow these steps to record and recall Performance Data (high speed, ¼ mile ET, and 0-60 time):

1. Before each run, your car must be at a complete stop at the starting position. *Press and hold* the pushbutton as it cycles through the performance data. At the end, the odometer will re-set and all performance data will be cleared. This will not affect your stored calibration value or the odometer reading.
2. Press the push-button until 'HI-SP' is displayed. The gauge will automatically cycle through the performance data.
3. Start the run, pass, session, etc., as mentioned above.
4. When finished, repeat *Step 2* to view the data gathered from the run. While stopped, you can view this data as often as you wish. However, once it finishes scrolling one time, the memory is ready to record new data and will begin recording again once the vehicle starts to move. The highest speed measured over multiple runs will be retained in memory.

## SPEEDOMETER CALIBRATION PROCEDURE

Your Intellitronix dash panel is equipped with our Digital Performance Speedometer which has factory settings that are ***pre-set with the industry standard setting of 8,000 pulses per mile to match your vehicles factory settings***. This electronic speedometer displays speed and includes an odometer, trip meter, high speed recall, 0-60 time, and quarter-mile elapsed time. It can be calibrated with the push-button to adjust the speedometer when you have ***Different sizes, wheel sizes, and gear ratios***.

The single push-button is used by a *quick tap* to toggle between odometer and trip meter. The microprocessor distinguishes between a *quick tap* and a *press and hold* which will reset the trip meter in trip mode or display performance data in odometer mode.

### CALIBRATION

The Digital Performance Speedometer leaves the factory with a factory pre-set industry standard setting of 8,000 pulses per mile. You should ***not have to recalibrate your speedometer, unless you have changed the original tire size or the rear end gear ratio***.

Also, if using the Intellitronix GPS Sending Unit, (S9021 – not included) the speedometer does not need to be calibrated.

***NOTE: DO NOT*** attempt to recalibrate your speedometer until after it is working properly, and you have determined that the speed is consistently incorrect. The calibration procedure will NOT correct a faulty installation or improper wiring.

***WARNING:*** If, while in 'CAL' mode, ***you do not move the vehicle but press the button again***, the microprocessor will NOT have received any data and the unit will display 'Err' and will revert to the factory settings. At a minimum, drive some distance and return to the start if necessary. If you miss stopping the display at 'CAL', simply repeat the steps.

To calibrate:

1. **Locate a measured mile or KPM where you can safely start and stop your vehicle.** By running the vehicle over this measured distance, the speedometer will learn the number of pulses outputted by the speedometer sensor during a specific measured distance. It will then use this acquired data to calibrate itself for accurate reading. There is a small recall pushbutton in the center of the panel used to calibrate and read all the data stored in the speedometer. After installing your speedometer according to the wiring instructions, when the ignition is on it should immediately display the default screen of **0 MPH**, if the vehicle is not moving.

**NOTE:** You will then need to drive your vehicle to the predetermined measured mile. During this trip, the speedometer should read something other than 0 MPH. If it does not change, return and locate the problem before continuing. Otherwise, proceed with the calibration.

2. Stop at the beginning of the measured mile with your vehicle running and in odometer mode (NOT trip mode), press and hold the push-button until the odometer displays 'HI- SP'. On its own, the gauge will then cycle through the recorded performance in the following order: '0 – 60', '1/4', 'ODO', and 'CAL'.
3. While 'CAL' is displayed, quickly *tap* the push-button once. This will put the speedometer in Program Mode. If you did not tap while 'CAL' is displayed, the pulses per mile will be displayed on the odometer and the display will go back to MPH mode. Otherwise, you will now see 'CAL' displayed along with the number '0'. This indicates that the microprocessor is now ready for calibration.
4. When you are ready, begin driving on the metered mile. You will notice that the reading will start counting. The odometer will begin to display the incoming pulse count. Drive the vehicle through the measured mile (speed is not important, only the distance traveled).
5. At the end of the mile, stop and press the push-button again. The odometer will now display the new number of speedometer pulses that were registered over the distance. The odometer will continue to display the pulse reading for a few seconds. Once it reverts to the default mode, you have successfully calibrated your speedometer.

FOR QUICK ANSWERS (**Q&A**) TO YOUR QUESTIONS

## **RETURN POLICY PROCEDURES**

### **Return Policy Instructions**

1. Download the Intellitronix Return/Repair Form and fill in the information on the form about the product.
2. Place the product being returned in the original packaging that it came in and include a copy of the completed Intellitronix Return/Repair Form.
3. All packages must be accompanied with an RMA Number.  
Please call Technical Support at +1 440-359-7200 ext 109 to receive an RMA Number.
4. Mail the product being returned with the completed Return/Repair Form and a copy of the original sales invoice.

### **Request for Product Refund**

All returns for a refund must have a completed Intellitronix Return/Repair Form included in the package with the returned product.

1. If the return is for a product that is not defective a 20% restocking fee will be charged. The product must be in the same pristine condition that it was sent to you.
2. Proof of purchase is required. Please include a copy of the original sales order with the returned product.
3. All product must be returned undamaged and in working order in the original packaging including plexiglass, sending units, mounting hardware, or you will be subject to additional charges for product and accessories not returned.
4. All refunds will be reviewed by the Accounting Office.

**This product carries a limited Lifetime Warranty.**

**This warranty is limited to replacement or repair of the unit at the discretion of Intellitronix**
